	Devin Almeida	2132	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 10 September 2007.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-13 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-13 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

This action is in response to the papers filed 9/10/2007. Claims 1, and 15-19, Currently claims 1-19 are under consideration.

Response to Arguments

Applicant's arguments have been fully considered but they are moot in view of new grounds of rejection necessitated by amendment.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-5, and 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hoefelmeyer et al (U.S. Patent 7,043,757) in view of Kilpatrick et al (U.S. 6,735,703). Hoefelmeyer teaches with respect to claims 1, 15, and 16, a method for preventing attacks in a monitored data processing system comprising the steps of: upon detection of an intrusion, identifying a malicious code string related to the detected intrusion (see column 6 lines 25-35 i.e. viruses are detected by the detection manager system); extracting the malicious code string (see column 6 lines 25-35); and forwarding the malicious code string to an intrusion limitation subsystem to reduce further

intrusions based on the malicious code string (see column 6 lines 25-43 i.e. upon detection of a new virus the detection manager system transmits the new signature to the remote site scanning system). Hoefelmeyer does not teach detecting an intrusion into the data processing system by monitoring system calls. Kilpatrick teaches detecting an intrusion into the data processing system by monitoring system calls (see Kilpatrick column 2 lines 11-22). It would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains to have also monitoring system calls to determine whether the system calls of a monitored process conform to the profiles of expected behavior (see Kilpatrick column 2 lines 11-22). Therefore one would have been motivated to have monitoring system calls.

With respect to claim 2, wherein the intrusion limitation subsystem comprises a pattern filter in the monitored system, and wherein said pattern filter compares incoming strings to the malicious code string for reducing further intrusions based on the malicious code string (see column 5 lines 15-64).

With respect to claim 3, wherein the intrusion limitation subsystem comprises a response server and wherein said response server (see column 6 lines 25-35 i.e. detection manager system) distributes the malicious code string to one or more connected systems (see column 6 lines 25-35 i.e. detection manager system transmits the new signatures to the remote site scanning system) to reduce further intrusions into such connected systems based on the malicious code string (see column 6 lines 25-35).

With respect to claim 4, wherein the one or more connected systems comprise one or more connected monitored systems (see figure 2).

With respect to claim 5, wherein the one or more connected systems comprise one or more connected monitoring systems (see figure 2).

With respect to claim 17, further comprising a sensor (see figure 1 element 122 124 126 140) for monitoring system calls sent to an operating system to detect code based intrusions (see column 6 lines 25-35 i.e. viruses are detected by the detection manager system).

With respect to claim 18, wherein the intrusion limitation subsystem comprises: a pattern filter connected to the code extractor for receiving extracted malicious code strings and for identifying patterns within a processed data stream that match the extracted code strings to prevent further intrusions based on the malicious code strings (see column 5 lines 15-64 and column 6 lines 25-35).

Claims 1, 6-8, and 15-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Made (U.S. Patent 7,093,239) in view of Kilpatrick et al (U.S. 6,735,703). Van Der Made teaches with respect to claims 1, 15, and 16, a method for preventing attacks in a monitored data processing system comprising the steps of: upon detection of an intrusion, identifying a malicious code string related to the detected intrusion (see abstract); extracting the malicious code string (see abstract); and forwarding the malicious code string to an intrusion limitation subsystem to reduce further intrusions based on the malicious code string (see abstract i.e. store patterns and sequences with there corresponding analysis results). Van Der Made does not teach detecting an intrusion into the data processing system by monitoring system calls.

Kilpatrick teaches detecting an intrusion into the data processing system by monitoring system calls (see Kilpatrick column 2 lines 11-22). It would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains to have monitoring system calls to determine whether the system calls of a monitored process conform to the profiles of expected behavior (see Kilpatrick column 2 lines 11-22). Therefore one would have been motivated to have monitoring system calls.

With respect to claim 6, further comprising the steps of: monitoring system calls from a daemon executed in a memory of the monitored data processing system (see column 2 lines 50 – column 3 line 15); and matching the system calls with one or more of established patterns and rules contained in a pattern matcher and representing a model of normal behavior (see abstract).

With respect to claim 7, wherein the matching of the system calls comprises establishing a non-deterministic automaton based on an analysis of executable code of the daemon (see column 2 lines 50 – column 3 line 15).

With respect to claim 8, further comprising the step of intercepting the system call via a subprogram of the sensor for observing the interaction of the daemon and the operating system (see column 2 lines 50 – column 3 line 15).

With respect to claim 17, further comprising a sensor for monitoring system calls sent to an operating system to detect code based intrusions (see abstract).

With respect to claim 18, wherein the intrusion limitation subsystem comprises: a pattern filter (see abstract) connected to the code extractor for receiving extracted

malicious code strings and for identifying patterns within a processed data stream that match the extracted code strings to prevent further intrusions based on the malicious code strings (see abstract).

Claims 9-11 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Der Made (U.S. Patent 7,093,239) in view of Kilpatrick et al (U.S. 6,735,703) in view of Kolichtchak (U.S. 2003/0014667). Der Made and Kilpatrick teaches everything with respect to claim 8 above but with respect to claim 9 does not teach the steps of inspecting a stack upon detection of an intrusion to retrieve an address leading to the malicious code string. Kolichtchak teaches the steps of inspecting a stack upon detection of an intrusion to retrieve an address leading to the malicious code string (see Kolichtchak paragraph 0032). It would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains to have inspected the stack upon detection of an intrusion to retrieve an address leading to the malicious code string to stop the spread of the malicious code and the effects of buufer overflow attacks (see Kolichtchak paragraph 0001-0004). Therefore one would have been motivated to have inspected the stack upon detection of an intrusion to retrieve an address leading to the malicious code string.

With respect to claim 10, on detection of an intrusion: locating, as a first element on the stack, a return address of a system call entry code from which the subprogram departed (see Kolichtchak paragraph 0032); and retrieving a return address of the malicious code string pointing to a memory location in the range in which the daemon is

executed from a second element on the stack positioned at or near the location of the return address of the system call entry code to facilitate finding and extracting of the malicious code string (see Kolichtchak paragraph 0032).

With respect to claim 11, scanning the memory range owned by the executed daemon starting from the return address in opposite directions until on one side a first region with a plurality of similar addresses and on the other side a second region with a plurality of similar instructions that do not alter the sequential control flow is identified (see Kolichtchak paragraph 0032); and extracting the malicious code string from between the first and second regions (see Kolichtchak paragraph 0032).

Claim 12 is rejected under 35 U.S.C. 103(a) as being unpatentable over Hoefelmeyer et al (U.S. Patent 7,043,757) in view of Kilpatrick et al (U.S. 6,735,703) in view of Kephart et al (U.S. Patent # 6,016,546). Hoefelmeyer and Kilpatrick teaches everything with respect to claim 3 above, but with respect to claim 12 Hoefelmeyer teach storing each malicious code string extracted in a database of the response server (see Hoefelmeyer column 6 lines 25-43). Hoefelmeyer does not teach correlating the stored malicious code strings to find sets of malicious code; and for each set, generating a signature that allows the individual identification of all malicious code strings contained in the corresponding set. Kephart teaches correlating the stored malicious code strings to find sets of malicious code strings (see Kephart column 6 line 49 – column 7 line 28); and for each set, generating a signature that allows the individual identification of all malicious code strings contained in the corresponding set

(see Kephart column 6 line 49 – column 7 line 28). It would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains to have grouped similar malicious code strings together to help reduce the amount of memory required to scan a given data string for the presence of computer viruses (see Kephart column 1 lines 56-65). Therefore one would have been motivated to have grouped similar malicious code strings together.

Claims 13, 14, 19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Hoefelmeyer et al (U.S. Patent 7,043,757) in view of Kilpatrick et al (U.S. 6,735,703) in view of Kephart et al (U.S. Patent # 6,016,546) in further view of Lamburt et al (U.S. Patent # 6,374,241). Hoefelmeyer, Kilpatrick and Kephart teach everything with respect to claim 12 above but with respect to claim 13 they do not teach wherein the correlating comprises utilizing an edit-distance algorithm. Lamburt teaches wherein the correlating comprises utilizing an edit-distance algorithm (see Lamburt column 41 lines 4-62). It would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains to have used a edit-distance algorithm to how far apart two strings of data are. Therefore one would have been motivated to have grouped similar malicious code strings together using a edit-distance algorithm and group them based on a distance smaller than a given distance apart (see Lamburt column 41 lines 4-62).

With respect to claim 14, wherein the sets have mutual edit distances smaller than a given threshold distance (see Lamburt column 41 lines 4-62).

With respect to claim 19, wherein the intrusion limitation subsystem comprises a response server comprising: a database for receiving extracted malicious code strings from the code extractor (see Hoefelmeyer column 6 lines 25-43); a correlate connected to the database for assembling sets of code strings having mutual edit distances less than a given threshold distance; a sequencer connected to the database for generating signatures, wherein a signature is generated for each set to facilitate identification of all malicious code strings contained in the corresponding set (see Lamburt column 41 lines 4-62); and a distributor connected to the database for distributing signatures to connected systems (see Hoefelmeyer figure 2 and column 6 lines 25-43).

Conclusion

Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of

Art Unit: 2132

the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

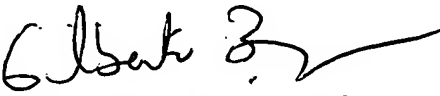

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Devin Almeida whose telephone number is 571-270-1018. The examiner can normally be reached on Monday-Thursday from 7:30 A.M. to 5:00 P.M. The examiner can also be reached on alternate Fridays from 7:30 A.M. to 4:00 P.M.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gilberto Barron, can be reached on 571-272-3799. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
